ASSIGNMENT

1. What is SQL?

SQL stands for **Structured Query Language**. It is a language used to communicate with a database. With SQL, we can create tables, add new records, view data, update existing details and delete records. For example, a college can use SQL to store and manage students' names, roll numbers and marks.

2. What is the difference between Data and Information?

Data means raw facts or details that have not yet been organised or explained. Information is data that has been processed and arranged in a meaningful way, so it becomes useful and easy to understand. For example, the marks 65, 75 and 80 are data. Saying that a student's average mark is 73.3 is information.

3. What are Database and DBMS?

A **database** is an organised collection of related data that can be stored, accessed and updated easily. For example, a bank database may contain customer details, account information and transaction records. A **DBMS (Database Management System)** is software that helps users create, store, manage and retrieve data from a database. It also helps maintain data security and accuracy.

4. What is a Relational Database Management System?

An **RDBMS** is a type of database management system that stores data in tables. Each table contains rows and columns, and tables can be connected using common fields such as an ID. This makes it easier to organise related data and retrieve it when needed. Examples include MySQL, Oracle Database and Microsoft SQL Server.

5. State at least 5 names of Database Management System or Software.

Some commonly used database management systems are:

- MySQL
- Oracle Database
- Microsoft SQL Server
- PostgreSQL
- SQLite
- Microsoft Access
